

5.7 Model Data from the Internet

TEKS a.5, A.1.B,
A.1.E, A.2.D

QUESTION How can you find reliable data on the Internet and use it to predict the total U.S. voting-age population in 2010?

EXAMPLE 1 Collect and analyze data

Find data for the total U.S. voting-age population over several years. Use an equation that models the data to predict the total U.S. voting-age population in 2010.

STEP 1 Find a data source

Reliable data about the U.S. population can be found in the online *Statistical Abstract*. Go to the address shown below. Click on a link to the most recent version of the *Statistical Abstract*.

Address

STEP 2 Find an appropriate data set

Choose the most recent “Elections” document. In this document, find the table of data entitled “Voting-Age Population.”

STEP 3 Find a model

Use a graphing calculator to make a scatter plot. Let x represent the number of years since 1980. Let y represent the total U.S. voting-age population (in millions). Find an equation that models the total U.S. voting-age population (in millions) as a function of the number of years since 1980.

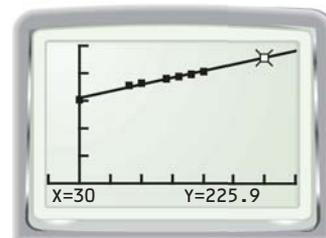

▶ $y = 2.23x + 159$

STEP 4 Predict

Use the model to predict the total voting-age population in 2010. You can either evaluate the equation for $x = 30$ or trace the graph of the equation, as shown.

▶ The total U.S. voting-age population will be about 225.9 million in 2010.

Year	Total (mil.)
1980	157.1
1988	178.1
1990	182.1
1994	190.3
1996	193.7
1998	198.2
2000	202.8

DRAW CONCLUSIONS

1. In the online *Statistical Abstract*, find data for the total value of agricultural imports over several years beginning with 1990.
2. Make a scatter plot of the data you found in Exercise 1. Find an equation that models the total value of agricultural imports (in millions of dollars) as a function of the number of years since 1990.
3. Predict the year in which the total value of agricultural imports will be \$45,000 million. Describe the method you used.
