

**EXAMPLE 2** Solve an inequality using multiplicationSolve  $\frac{x}{-6} < 7$ . Graph your solution.

$$\frac{x}{-6} < 7 \quad \text{Write original inequality.}$$

$$\rightarrow -6 \cdot \frac{x}{-6} > -6 \cdot 7 \quad \text{Multiply each side by } -6. \text{ Reverse inequality symbol.}$$

$$x > -42 \quad \text{Simplify.}$$

► The solutions are all real numbers greater than  $-42$ . Check by substituting a number greater than  $-42$  in the original inequality.

$$\text{CHECK } \frac{x}{-6} < 7 \quad \text{Write original inequality.}$$

$$\frac{0}{-6} < 7 \quad \text{Substitute 0 for } x.$$

$$0 < 7 \quad \checkmark \quad \text{Solution checks.}$$

**AVOID ERRORS**

Because you are multiplying by a negative number, be sure to reverse the inequality symbol.

**USING DIVISION** The rules for solving an inequality using division are similar to the rules for solving an inequality using multiplication.

**KEY CONCEPT***For Your Notebook***Division Property of Inequality**

**Words** Dividing each side of an inequality by a *positive* number produces an equivalent inequality.

Dividing each side of an inequality by a *negative* number and *reversing the direction of the inequality symbol* produces an equivalent inequality.

**Algebra** If  $a < b$  and  $c > 0$ , then  $\frac{a}{c} < \frac{b}{c}$ .      If  $a < b$  and  $c < 0$ , then  $\frac{a}{c} > \frac{b}{c}$ .

If  $a > b$  and  $c > 0$ , then  $\frac{a}{c} > \frac{b}{c}$ .      If  $a > b$  and  $c < 0$ , then  $\frac{a}{c} < \frac{b}{c}$ .

This property is also true for inequalities involving  $\leq$  and  $\geq$ .

**EXAMPLE 3** Solve an inequality using divisionSolve  $-3x > 24$ .

$$-3x > 24 \quad \text{Write original inequality.}$$

$$\frac{-3x}{-3} < \frac{24}{-3} \quad \text{Divide each side by } -3. \text{ Reverse inequality symbol.}$$

$$x < -8 \quad \text{Simplify.}$$
